

Five

Deal Management

Five deals a week. You will know when one goes quiet.

Deal management for one to five sellers, built by someone who carried a bag for fourteen years. Your own instance, on European infrastructure in Frankfurt or Stockholm.

Pick five

Five slots on the desk, and the app refuses a sixth. A list of everything is a filing cabinet. Five is a week's work.

Write what happened

One line after each call, or paste the email you actually sent or received. That is the whole input.

Get told what is dying

It reads the gaps and the wording across the whole history and names the deal that has stopped moving, and why.

// the problem

The expensive deals are the quiet ones

Pipeline review catches the deals someone remembers to raise. It rarely catches the one that has not really moved in six weeks. There is no bad news to report and nothing to mark lost, so it sits in the forecast at full value while everyone assumes somebody else is on it.

By the time a quiet deal surfaces, the useful window has closed. Nobody was negligent. The signal was spread across forty notes and eleven months, and no one had time to read them.

// what it hands you

A verdict, not a summary

It reads a deal's whole note history and returns a judgement on whether the deal is still moving, with the reasoning that produced it. A summary tells you what was said. This tells you what it means, and shows its working so a rep can push back on it.

> "Both contacts gave a positive buying signal and want implementation, but the deal is blocked on an administrative gap: no entity, VAT or company number, so the local office cannot raise a purchase order. There is a plan, a rep flying out on the 26th, but that is over three weeks away with no interim step."
>
> A real verdict, anonymised.

// features

Five prospect slots

Capped in the application, not suggested. Each slot shows how long it has been held, so a prospect you have not moved in three weeks says so.

Notes that stay honest

Editable in place, but the original date never moves, so correcting a typo cannot make a deal look more recently active than it is.

Drafting in seven languages

A follow-up written from the deal's own history, in English, Dutch, German, French, Spanish, Italian or Portuguese. Copy it out; nothing is ever sent for you.

Pipeline health

One score from the stored verdicts, with open and won value and the average time to close, and it tells you how stale the reading is.

The desk

Pipeline, prospects, their people and their deals in one view that does not reflow. Opening a deal never moves the panes around it.

Email on the record

Paste any email, sent or received, with its subject, and file it against a person and a deal. Direction is recorded, because a reply is not another chase.

Confidential notes

Mark any note or email confidential and it is never sent to the model, in any form, including drafts. Still fully visible to you.

Your data, in your tools

On Team and Private the database is yours. Power BI and Excel both read PostgreSQL natively, so your reporting lives where your reporting already lives.

// the ai, in specifics

Three questions	What it asks depends on where the deal stands. Open gets a momentum read, lost gets a post-mortem, won gets a repeatability analysis. Asking "summarise this deal" wastes the most useful thing you already know.
Structured, not prose	Forced tool use against a fixed schema, so every answer is checkable rather than merely plausible. When a verdict is wrong you can see which signal it read wrong.
Validated and repaired	Malformed output is trimmed and retried against the model's own rejected call, not silently accepted. Only a genuinely empty answer fails.
Your history only	It reasons over your notes and nobody else's. No shared corpus, no training on your data. Confidential notes never reach a prompt at all.
Unmetered	No credits, no per-action charge, no AI add-on tier. Affordable precisely because the app holds five deals rather than everything you have ever touched.

// under it

Application	Next.js 16, React 19, TypeScript, Tailwind CSS. Server-rendered.
Data	PostgreSQL, managed, in the EU. Row level security on every table, so isolation is enforced by the database rather than by a filter someone can forget.
Model	Mistral, a European model provider, through its EU-hosted API. The key is read by one server-side module and never reaches a browser.
Hosting	UpCloud, Frankfurt (DE-FRA1) as standard, Stockholm (SE-STO1) for Nordic customers. Zero-cost data transfer, so nothing is metered by the gigabyte. Customer notes do not leave the EU.
Payments	Card details are handled on the payment provider's hosted checkout and never touch our servers.
Migrations	Versioned in the repository and applied in order. Every schema change is reviewable.
Reporting	None built in, deliberately. A read-only SQL connection on Team and Private lets Power BI, Excel or any SQL client read your own database directly.
Accessibility	Contrast measured, not estimated, in both themes. Status is never carried by colour alone.

// your data

Where it lives	One database per customer on Team and Private, in Frankfurt or Stockholm. Shared only on Solo, and isolated there by row level security rather than by application code.
Who can read it	You. Support access is not standing, and a private instance can be handed over whole if you leave.
What leaves	The notes on the deal being analysed, at the moment you press the button, and only to an EU model endpoint. Nothing is used for training, nothing is pooled with another customer, and confidential notes are excluded before the request is built.

// pricing

Solo

€39 / month

one seller

- ✓ Shared instance in Frankfurt, your rows isolated at the database
- ✓ Unlimited analyses and drafts
- ✓ Light and dark as standard

Team

own database

€149 / month

up to three sellers

- ✓ Your own database, on shared infrastructure in Frankfurt
- ✓ Read-only SQL connection for Power BI and Excel
- ✓ Unlimited analyses and drafts
- ✓ Everything in Solo

Private

€350 / month

up to five sellers

- ✓ Your own instance and database, on your own subdomain
- ✓ Frankfurt or Stockholm, your choice
- ✓ Read-only SQL connection for Power BI and Excel
- ✓ Unlimited analyses, or bring your own model key
- ✓ Signed data processing agreement
- ✓ Your brand on request

Prices excl. VAT. Pay yearly and get twelve months for ten. Thirty days to try it, because the reading needs a note history before it has anything worth saying.

// what is not here

The list stops at five sellers, and that is not an oversight. There are no roll-up views, no deal ownership, no territories, no marketing and no app marketplace. A tool built on a cap of five has no business pretending to run a sales floor. **Reporting is absent for a different reason:** the database is yours, and Power BI and Excel read PostgreSQL natively, so a dashboard built into this app would be a worse version of one you already own. If you need the rest, buy Pipedrive or Salesforce. Are you bigger than five? Ask anyway, because there are custom options.

See it on a real deal

The demo opens straight inside a company with a year of notes behind it, including two enterprise-scale cycles of more than fifty timestamped notes each. Press Analyze and read what it says.
